WHEAT STATISTICS:
SUPPLY AND UTILIZATION BY CLASS, 1929-59

By

H. C. Williams and Yi Wang 1/

INTRODUCTION

The purpose of this publication is to present derived data and the methodology used in estimating the disposition of wheat by class in the major utilization outlets.

There are five major classes of wheat (Hard Red Winter, Hard Red Spring, Soft Red Winter, White and Durum) produced domestically. Each moves into four major price determined outlets. They are: (1) Human consumption as food, (2) Livestock consumption as feed, (3) Commercial storage and (4) Exports.

Data relating to the utilization of all wheat as an aggregate are published for each of the four major price determined outlets (See Appendix III). In addition, data on total wheat used for seed and industrial purposes are published. For individual classes of wheat published data are not as complete and comprehensive as for all wheat as an aggregate. For individual classes of wheat the following breakdown is reported.

1/ Associate Professor and Research Assistant, Ohio Agricultural Experiment Station.

- (1) Carryover stocks, July 1
- (2) Production
- (3) Imports
- (4) Supply
- (5) Exports
- (6) Carryover
- (7) Domestic Disappearance

Here domestic disappearance is a balancing item. These data are shown in Appendix II.

Domestic disappearance, however, is also an aggregate, which includes human consumption as food, livestock consumption as feed, seed use, and industrial use. Some rationale is needed for the disaggregation of domestic disappearance into its components. The data do not suggest ways in which this might be done.

To disaggregate domestic disappearance it was necessary to make several assumptions and develop consistent techniques for the disaggregation process. These assumptions are stated in the appropriate places in the development process.

Farm disposition of wheat by type of utilization is published annually for each state. However, these data are for "all wheat", as an aggregate, produced within the state. (See Appendix I.) These data provided a basis for the disaggregation of domestic disappearance to obtain its included components. However, if these data were to be used some technique was needed to isolate the quantities of the respective classes of wheat moving into the utilization outlets.

The United States Department of Agriculture makes a quinquennial survey of the percentage distribution of varieties and classes of wheat produced domestically. This survey has been made since 1919. These data are shown in Table I A-E for the major producing states. States, in which minor classes constituted less than 5 per cent of the total wheat were not included in the computation for the particular class. It was assumed that in these cases the wheat produced was used for seed, feed or some other special purpose and therefore should not be distributed proportionately to various uses. As a result, 26 states were used in the compilation of farm disposition data for soft red winter wheat, 23 for hard red winter wheat; 18 for hard red spring wheat; 15 for white wheat and 7 states for durum wheat.

With these data the assumption was made that percentage distribution of the utilization of wheat by class would not differ from the percentage distribution of production by class. On the basis of this assumption it became possible to compute the farm disposition of wheat by class by five year periods. However, this was not adequate since it was deemed desirable to derive annual utilization data. In order to use the percentage distribution of production to derive utilization by class annually, it was necessary to make an assumption regarding the yearly distribution within these five year periods. The assumption was made that a linear relationship existed. On this basis yearly percentages were derived. See Table 2 A-E. Percentages for 1955-59 were estimated from data supplied by several states, from trends exhibited in the data from 1944-54 and where no basis existed for estimating, the value for each year after 1954 was assumed to be the same as that for 1954.

These yearly percentage distributions were then applied to total farm disposition, by type of outlet in Appendix Table I, to derive farm disposition by class. These data provided annual state use for (1) seed, (2) feed for livestock on farms where grown, (3) home use and (4) sold. These data are shown in Tables 3 A-E.

These data were then aggregated over states, by classes and years, to obtain annual total farm utilization by class and type of utilization. See Tables 4 A-E.

The derived data, together with those data in Appendixes II and III then made it possible to obtain a more comprehensive division in the utilization of total supply of each class of wheat. These data are shown in Tables 6 A-E. In these tables the residual or balancing item (Column 9) includes wheat used for food, wheat used by commercial feed mixing firms, wheat used for industrial purposes, and any errors that might have occurred in the final production estimates and major utilization components that were assumed to be measured without error.

The seed use figures in Column 8 of Tables 6 A-E are adjusted figures. The adjustments were made to account for minor states and classes omitted, and to make our computed figures comparable with published figures on seed use as shown in Appendix III. This was done by taking the difference between reported (shown in Appendix III, Column 6) and computed (summation over various classes) seed use and distributing the difference over the classes on the basis of the percentage distribution of classes. This computation is shown in Table 5.

The use of wheat for feed as shown in Column 7 of Tables 6 A-E relates only to that portion fed on farms where grown. These data do not

contain quantities used by commercial feed mixing firms. Wheat is an important constituent of certain animal rations. This is especially true of poultry rations where wheat plays an important role as a scratch grain. No reliable estimates exist for the quantity used by the commercial feed mixing firms. Meinken estimates that on the average 11 million bushels were used annually prior to 1930. 1/ Contacts with the industry in Ohio, Kansas and Nebraska indicated that very little wheat was used commercially for feed and that which was used, in the main, was unfit for human consumption.

A comparison of computed and published feed use figures after 1930 and excluding the war years indicate that wheat fed on farms where grown as a percent of published feed use ranged from 64.6 to 99.5 per cent. The difference between the two series was greater after World War II than before. This probably reflects a proportionate increase in commercial feed use associated with the expansion in commercial poultry production. During the War years, total feed use was much greater than computed feed use of wheat fed on farms where grown.

From 1942 to 1946 an average of 318 million bushels of wheat was fed annually, compared with an annual average of 117 million bushels from 1929 to 1941. "This high usage was stimulated by a wheat-feed subsidy program, which was initiated because of a relatively tight supply of corn, a huge supply of wheat, and a high demand for livestock products." 2/ Then too, part of the difference between the computed and published figures is due to errors in final production estimates

1/ Meinken, K. W., The Demand and Price Structure for Wheat. U. S. Department of Agriculture Technique Bulletin 1136. 1955 p. 38.

2/ Nauheim, Charles, et.al., Wheat Production: Trends - Problems - Programs - Opportunities for Adjustment. U.S.D.A., A.R.S., Agriculture Information Bulletin 179, 1958 p. 42.

or in other major utilization components. The largest error occurred in 1929 when the computed feed use was twice as great as the published figure. Meinken concluded that published feed use statistics prior to 1930 were subject to serious data limitations and chose to use independent estimates of the Crop Reporting Board of wheat fed on farms where grown plus an allowance for commercially used wheat in feed rations. 1/ A comparison of the computed feed use figure for 1929 with the total wheat fed figure used by Meinken indicates that wheat fed on farms was 83 percent of the total fed. The computed figure when adjusted for commercially used wheat for feed was 685,000 bushels less than the quantity derived by Meinken. 2/ This difference is probably attributable to omitted states and classes as pointed out earlier. These adjusted feed use data are shown in Table 12.

Table 7 presents published data on supply and disappearance of all wheat. These data were taken from Appendix Tables II and III. Data relating to supply, carryover and exports were taken from Appendix Table II, while data relating to domestic disappearance by utilization outlet were taken from Appendix Table III. This, in the main, permitted the isolation of quantities of all wheat moving into the various utilization outlets. However, there were several discrepancies noted between the two tables on exports and domestic disappearance.

For example, in the year 1930 Appendix Table II reports 115 million bushels and 751 million bushels of exports and domestic disappearance of all wheat, respectively. For these same categories for 1930 Appendix

1/ Ibid. P. 23.

2/ Adjusted by adding 11 million bushels to farm feed use.

Table III reports 106.3 and 759 million bushels, respectively. Total supply and carryover are identical in both tables. Since Appendix Table II presented data on supply, exports and carryover of all wheat as well as individual classes of wheat, and further since these data were internally consistent, it was felt that these data would more adequately serve as a basis for the derivation of total food use. In view of this, data relating to total supply, exports and carryover were taken from Appendix Table II. Data relating to domestic disappearance, excluding food use, were taken from Appendix Table III. Food use was computed as a residual.

The food use data of Table 7 were used as a check on the summation over all classes of computed food use. The total computed food use data were adjusted to the food use data in Column 11 of Table 7. This was done by distributing the difference over all classes on the basis of the annual percentage distribution of class food use to total computed food use. These data with revisions noted on Page 7 are shown in Table 8.

The adjusted food use data of Table 8 are used to determine per capita consumption. However, these data include a part of military procurement, which was published separately beginning in 1941. ^{1/} It might be argued that since military procurements do not normally affect the price - quantity relationship in the several price determined outlets they should not be included in total supply. Table 7 does not report military procurements separately. Rather, they are distributed between domestic disappearance and exports as shown in Table 16 so that

^{1/} Military food use at home and abroad is included in domestic food use. Prior to October, 1954, exports included those for civilians feeding under the military supply program.

domestic disappearance and exports in Appendix Tables II and III are in agreement.

An alternative computation was made removing military procurements from supply and disposition. The derivation of these data involved adjusting computed domestic food use data in Table 7 to the food use data presented in Appendix III and adjusting exports in Appendix Table II to exports and shipments to United States territories as shown in Appendix Table III.

In Table 9 the computed food use by class reported in Columns 1-5 were adjusted so that their sum was equal to the quantity processed for food shown in Column 5 of Appendix Table III. In addition to adjusting computed food use data to remove military procurements from domestic food use after 1940, computed food use was adjusted for the years prior to 1941 to correct the discrepancies between domestic disappearance and exports found in Appendix Tables II and III. The revised data for 1929-1940 are included in Table 8 so that total food use in Tables 8 and 9 are in agreement when there was no military procurement.

Table 10 presents data on adjusted exports. The difference between exports and shipments in Appendix Table III, and exports in Appendix Table II were distributed over the reported exports by class in Appendix Table II on the basis of an annual percentage distribution of each class to total exports.

Table 11 shows the supply and disappearance of wheat as an aggregate. In this table feed was computed as a residual. As such it includes commercial feed and the differences between the supply figures appearing in Appendix Table II and Appendix Table III. Then data on

various classes of wheat used for feed were adjusted to this residual. The adjustments are shown in Table 12.

Tables 13 A-E present adjusted supply and disposition data by class of wheat. In these tables military procurement, seed and industrial use were eliminated.

The summation of corresponding columns in Tables 13 A-E were combined to make Tables 14 and 15. These two tables served as a check on the computation of class use.

FOOTNOTES FOR TABLE 2 - A

- ¹ 1954 projected.
- ² Data were furnished by the Illinois Crop Reporting Service. Varieties not reported were distributed proportionately to the various classes.
- ³ Data for 1955-57 and 1958 were obtained from "Varieties of Wheat, Oats and Barley grown in Indiana," published by the Agricultural Experiment Station, Purdue University, 1958. 1959 projected.
- ⁴ Projected zero per cent after 1954.
- ⁵ Projected 100 per cent soft red winter wheat.
- ⁶ Per cent for 1955 obtained from "Michigan Agricultural Statistics," Michigan Department of Agriculture, 1957. 1956-59 projected.

Source: 1929-1954 interpolated from Table 1 - A. 1955-59 projected.

FOOTNOTES FOR TABLE 2-B

¹Based on estimates of Arizona Agricultural Estimates Division, A.M.S., U.S.D.A.

²1954 projected.

³Data were furnished by the Illinois Crop Reporting Service. Varieties not reported were distributed proportionately to the various classes.

⁴Data for 1955-57 and 1958 were obtained for "Varieties of Wheat, Oats and Barley Grown in Indiana" Agricultural Experiment Station, Purdue University, 1958. 1959 projected.

⁵Projected assuming linear trend since 1945.

⁶Projected 100 percent hard red winter wheat.

⁷Based on data from "Minnesota Agriculture 1858-'58" Minnesota State Federal Crop and Livestock Reporting Service, 1958. 1959 projected.

⁸Computed from information furnished by the Nebraska Agricultural Estimates Division, A.M.S., U.S.D.A. 1959 projected.

⁹Based on information from Agricultural Statistician of New Mexico.

¹⁰Projected zero percent after 1954.

¹¹Based upon data shown in "South Dakota Agriculture, 1955" and issues for 1956-'57 and 1958. 1959 projected.

¹²Based upon information from Utah Agricultural Statistician.

Source: 1929-54 interpolated from Table 1-B 1955-59 projected.

1/ Computations are made by multiplying the reported disposition of all wheat shown in Appendix Table I by the respective percentage distributions shown in Table 2 A-E.

* - Less than 500 bushels used in this outlet.

1/ (Computed from unrounded data)

Source: Columns (1)-(5) are obtained from column (2) of Tables 4-(A-E).
 Column (6) is the sum of columns (1) to (5).
 Column (7) is the reported figure in Column (6) of Appendix III.
 Column (8) = (7) - (6).
 Columns (9) - (13) are adjusted figures. Adjustments are made by distributing the differences proportionately to each class so that the sum of adjusted seed use figures of all classes is equal to the published seed use figures.

(Computed from unrounded data)

Source: Columns (1) - (5) are obtained from column (9) of Table 6 - (A-E).

Column (6) is the sum of columns (1) to (5).

Column (7) 1929-40, Appendix III; 1941-59, Column 11 of Table 7.

Column (8) = (6) - (7).

Column (9) - (13) are adjusted figures. The adjustments were made by distributing the differences between computed and published food use figures of all wheat for each year proportionately into each class so that the sum of adjusted food use figures of all classes was equal to the published food use figures.

Source: Adjusted figures. The adjustments were made by taking the difference between the sum of computed food use of the various classes of wheat (column 6 of Table 8) and the officially published food use figures for all wheat (column 5 of Appendix III, which represents civilian food use figures), and distributing the difference to each class by applying the same percentage distribution used in Table 8. The purpose of this adjustment was to eliminate military procurement from the total wheat used for human consumption and thus to obtain the net civilian consumption of wheat by classes.

Source: 1/ Figure used by Meinken. Kenneth W. Meinken - Demand and Price Structure for Wheat USDA Tech. Bulletin No. 1136.
Columns (1) to (5): Column (4) of Table 4 A-E.
Column (6): Sum of Columns (1) to (5)
Column (7): Column (8) of Table 11
Column (8): Column (7) - Column (6)
Column (9)-(13): Adjusted figures. Adjustments are made by distributing the difference of Columns 7 and Column 6 over the classes on the basis of percentage distribution of classes.
Column (14): Sum of Columns (9) to (13)

Computed from unrounded data.

FOOTNOTES for APPENDIX II

¹New wheat in commercial and merchant mill stocks prior to July 1, 1937 included in figures for years and in the average.

²In addition to wheat grain, includes grain equivalent of flour made from U. S. wheat; also semolina and macaroni (in terms of wheat) for years beginning July, in million bushels, as follows: 1929-41, less than 1; 1942, 1; 1943, 1; 1944, 2; 1945, 1; 1946, 3; 1947, 6; and 1948, 1; other years less than 1 except 1956, 1. Also includes shipments to territories of the United States.

Note: Figures by classes in this table are not based on survey or enumeration data and are therefore only approximations. Estimated stocks on farms and in interior mills, elevators, and warehouses by kinds, are assumed to be present in about the same proportion as produced; the classes within kinds are established on the basis of the quinquennial wheat-variety surveys. Commercial stocks are reported by classes, and merchant mill stocks are broken down largely on the basis of allowance for quantities going for export. CCC inventories by classes July 1 became available beginning 1955. Exports and shipments by classes are estimated on the basis of "inspection for export" for wheat as grain, and on the basis of the area from which exports are made for flour; also, on the basis of records of the former War Food Administration and the Department of Agriculture, and export indemnifying agencies.
